

F-Secure Mobile Security for Business

Smartphones are effectively small computers and face many of the same threats as workstations and laptops. Mobile malware and spyware pose extra security risks for businesses, lowering productivity and causing business continuity problems. If the phone is lost or stolen, you need to be sure that your confidential business information cannot be misused by anyone. F-Secure Mobile Security for Business offers total protection for business smartphones and also provides centralized management for IT administrators.

Instant protection against loss or theft

Mobile phones can easily be lost or stolen – so it's important that you have a way to protect and remotely control the device. F-Secure Mobile Security for Business introduces the advanced antitheft feature with remote lock, remote wipe and theft control functionalities. Remote lock can be used to lock the device to protect confidential information quickly and easily with a single SMS message. The theft control feature activates when the SIM card is changed by locking the device. As an ultimate safety measure to prevent misuse, it is possible to erase all the data on the phone with remote wipe. You can be sure that your confidential information won't be misused by anyone.

Features you can rely on

The solution works invisibly in the background, scanning all network traffic and monitoring the device for malware. The application combines real-time antivirus functionality with a firewall, antitheft and antispware, making the device completely safe for today's connected life.

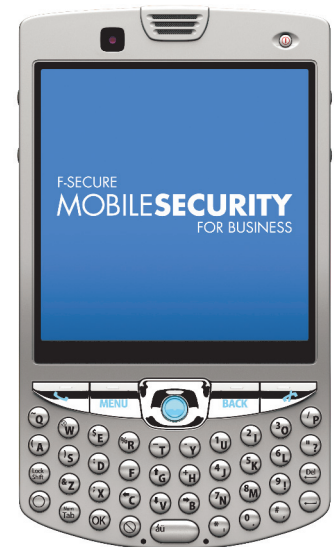

F-Secure Mobile Security for Business automatically retrieves the newest updates whenever any data connection is used. An additional SMS update mechanism patented by F-Secure ensures that critical malware fingerprints are received even when a data connection is not available.

Centralized management and monitoring

IT administrators can centrally monitor the protection status of the company smartphones by using the F-Secure Mobile Security for Business management portal. The administrator can easily add smartphones into the management portal, send a download link and a service activation code as an SMS message directly to the phones, and monitor the service status and subscriptions with a standard web browser.

Protects you against:

- > Misuse of confidential information in case the phone is lost or stolen
- > Mobile spyware monitoring your phone usage
- > Unwanted billing caused by viruses that are trying to spread
- > The device becoming unusable due to malware

F-Secure Mobile Security for Business key features

Antitheft

If your phone is lost or stolen, F-Secure Mobile Security for Business helps to safeguard confidential data. The antitheft offers three new features to keep your data safe: remote locking, remote wiping and theft control.

Antispyware

Protects against spyware and espionage software that may monitor and record all the actions on a mobile phone, including voice calls, SMS, multimedia and e-mail messages.

Antivirus and customizable Firewall

Combined real-time antivirus protection with a customizable firewall makes the device completely safe against mobile viruses and malware.

Smooth user experience

Security has never looked better. The new smooth user interface is all about making security easy.

Unique advanced automatic updates

A unique 2-layer update mechanism automatically retrieves the newest updates whenever any data connection is used. Advanced SMS updates ensure that you receive the critical updates even when a data connection is not available.

Light, efficient and easy

Thanks to light and efficient scanning technology, F-Secure Mobile Security for Business gives you full protection without affecting the smartphone user experience. The new smooth user interface is all about making security easy.

Central management

Centralized management makes it easy for an IT administrator or partner to monitor the protection status of all the smartphones in the service.

Device management

F-Secure Mobile Security for Business supports the device management standard defined by Open Mobile Alliance (OMA). To utilize the device management the company should have, for example, the Nokia Intellisync or mFormation device management system. Administrators can use the device management system to perform complicated or repetitive management tasks over the air on behalf of the end user.

Support for all the most popular smartphones

All popular smartphone models are supported - over 150 different Windows Mobile and Symbian devices from all the major vendors like Nokia, Sony Ericsson, Toshiba, Motorola, HTC, Samsung and co-branded devices.
