

SERVER SECURITY

SECURITY FOR YOUR BUSINESS-CRITICAL ASSETS

Server Security is a key security element.

Servers face the same vulnerabilities and threats as workstations. With the critical role they play in corporate IT, they are a natural target.

In addition to standard signature based engines, F-Secure Server Security uses browsing protection and advanced behavioral analysis to provide protection for file servers against malware and software exploits.

SECURING SERVERS

Against malware and software vulnerabilities without slowing the system down.

- ✓ Server Security offers essential security - most compromised data involves servers.
- ✓ Server Security reduces costs as it has a low impact on virtual or physical environments.

SERVER SECURITY

POWERFUL PROTECTION FOR SERVERS

F-Secure Server Security is a server security software solution that provides protection for file servers against malware and software exploits.

Microsoft file server protection

Get unmatched protection against viruses, Trojans, rootkits, and other malware.

DeepGuard™

Our proactive on-host protection engine.

Web traffic scanning

Detects and blocks malicious content in web traffic (HTTP protocol) to provide additional protection against malware.

Browsing protection

Protection for your terminal users against web browser exploits and rogue web sites.

Offload scanning agent

Allows you to offload malware scanning to F-Secure Scanning and Reputation Server in Virtual and Cloud Environments.

Software Updater

Keeps your system and applications up to date by installing patches as they are released by vendors.

Botnet Blocker

Stops criminals aiming to control compromised assets by preventing communication to Command & Control domains.

Advanced Protection

Allows the administrator to block selected content from unknown or suspicious sites.
